COMMITTEE LEARNING OBJECTIVES

To know the basic principles of Cancer biology, To be able to define the mechanisms responsible for the genetic diseases and to give examples of related diseases, To know the chromosomal abnormalities and to give examples of diseases related to these mechanisms, To be competent in genetic technologies used in the field of personalized medicine.

To learn DNA and RNA synthesis, repair mechanisms, and possible mutations and modifications from a biochemical perspective. Understanding the biochemical targeting pathways and processes of newly synthesized proteins. To define the regulation of gene expressions. To learn the chemical properties, functions and metabolism of the extracellular matrix. To explain information about bone and cartilage biochemistry. To learn the muscle biochemistry.

It examines the process from the 4th week of embryological development to birth. Defines fetus and newborn. Examines muscle and nerve tissue histology.

Active movement in the human body is the voluntary change of place and position of any part of the body. The most important anatomical structures that functionally perform active movement in the human body are the structures within the locomotor system, including arthrology, myology, and the spinal nerves that branch from the medulla spinalis in the peripheral nervous system. In this course module, all anatomical formations located topographically on the walls of the living body (joints, muscles, vessels, nerves, and membranes) will be learned through practical applications. This will facilitate our systematic and topographic placement and understanding of the human body.

Should be able to define the distinction, structure and functions of nerve and glial cells, explain the differences between myelinated and unmyelinated nerves, and the physiopathology of demyelination diseases. Should be able to define nerve growth factors, peripheral nerve degeneration and regeneration. Should be able to define skeletal muscle morphology, dystrophin-glycoprotein complex, sarcomere structure. Should understand the molecular basis of striated muscle contraction. Should be able to explain energy metabolism and differences in different muscle types. Should understand the role of EMG in recording muscle activity and muscle pathologies. Must know the pathophysiology of diseases such as muscular dystrophies, myopathies, channelopathies, and be able to define the Autonomic Nervous System and major Neurotransmitters.

The Effective Patient-Physician Interview course aims to provide medical students with communication skills that will strengthen the patient-physician relationship. The main goal of this course is to ensure that students develop basic communication competencies such as empathy, active listening, openness and trust. In addition, it is aimed to make them aware of issues such as accurate information transfer, confidentiality and ethical values in patient-physician interviews. In multidisciplinary practice laboratories, it is aimed to provide students with practical applications with simulated patients along with theoretical knowledge, and to enable them to establish safe and effective communication with patients.
